

Project Title: Student Records Management.

Objective: The primary objective of this program is to provide a centralized digital interface for faculty members to record, store, and view student academic performance. It replaces manual paper-based grading by automating the calculation of total scores and ensuring data persistence through a local database.

Features: Users can add new student records and instantly view the updated list of students. Real-time grade summation automatically calculates the "Total Score" by summing Quizzes, Midterms, and Final exams within the HTML template. Responsive Web UI by using Flask.

Applications in Real Life: Classroom management small to medium sized educational institutions can use this to track student progress throughout a semester. Automated report generation This code serves as a foundation for generating digital report cards.

Algorithms Used: Linear summation algorithm to calculate the final grade, the program uses a basic arithmetic sum. Relational mapping It maps Python tuples (data from the database) to HTML table rows using a templating loop.

Tools Used: Python, Flask, SQLite3, Jinja2, HTML, CSS.
